PROFESSIONAL SUMMARY

Unity developer with seven years of experience, currently running three games concurrently using Claude spec-driven development: WishSeekers, a 2.5D action roguelite where he is sole engineer on the full gameplay codebase; Firebot Auto Battler, a live-service Twitch-integrated battler with persistent accounts and betting payouts; and Limb From Limb, a complete game shipped in two weeks as engineering lead. Each is written spec-first and implemented against that spec, which is how three projects stay in flight at once. Builds internal tooling as a matter of course, from a Unity sandbox tool at Meta to custom editor tools and an Inspector-level balance guide for non-programmers.

CORE COMPETENCIES

AI-Assisted Development, Spec-Driven Development, Rapid Prototyping, Internal Tooling and Automation, Gameplay Systems Architecture, Unity 6 and C#, Live-Service Systems, Shipping to Deadline

EXPERIENCE

Meta

December 2023 - December 2024

Technical Artist

- Wrote a Unity sandbox tool for sound engineers to test ambient and avatar sounds, optimizing noise profiles in high- and low-traffic settings.
- Improved performance for Horizon Worlds (100k+ users) on Unity by writing shaders and optimizing in-house asset creation and profiling tools.
- Worked cross-functionally with engineers, artists, and designers, scoping technical feasibility and requirements for new seasonal content.

FiveMics

August 2022 - November 2023

Backend Engineer

- Partnered with the CEO to architect the full system design for the FiveMics card game, scoping the multiplayer concept and its supporting infrastructure.
- Developed secure REST APIs on API Gateway with Lambda functions to handle account registration, authentication, and user profile management.
- Developed a full-stack onboarding and registration flow with UX artists and designers, supporting Desktop, Google and Apple sign-in via Cognito, DynamoDB and Unity.

Ultraviolet

April 2021 - June 2022

Unity Developer

- Led a small team of Unity developers, junior engineers, and contractors to build a metaverse prototype for the Octi social media app.
- Built a networked multiplayer prototype in Unity Mirror supporting 10+ concurrent players, with builds deployed to a Lightsail-hosted server and configured through Unity command-line parameters.
- Integrated the Unity stack into the studio's existing Docker deployment pipeline, previously Xcode-only, using unity-docker to containerize the correct Unity build.
- Increased community engagement by 20%, reaching #1 in the social media category for two weeks.

Evava VR

September 2020 - March 2021

Unity Developer (AR)

- Built Unity prototypes demonstrating AR capabilities to shareholders and in business pitches to garner funding.
- Produced AR experiences using ARKit and Unity for venues including South Coast Plaza, featuring an AR Santa for the COVID holiday season and a bunny-stomping game controlled with interactive floor projections.

SELECTED PROJECTS

WishSeekers

Solo Gameplay Programmer, Unity 6 / C# (Apr 2026 - Present)

- Ran the project spec-first using Claude for AI-assisted development, with the 14-guide documentation set serving as the working specification the gameplay implementation is driven from.
- Sole engineer on the full gameplay codebase, built on a ScriptableObject data layer with all damage routed through one resolution pipeline (modifiers, crit, mitigation, absorb, afflictions) shared by 30+ abilities.
- Created in-game debug GUIs and custom editor tools for live tuning, plus a 14-guide technical documentation set and an Inspector-level balance guide for non-programmers.

Firebot Auto Battler

Live-Service Systems, Twitch Integration, Real-Time Overlay (May 2026 - Present)

- Built with the same Claude spec-driven workflow: the design plan is written first and implemented against, which is what made a single-slice scope hold under a live-stream deadline.
- Designing and building a Twitch-integrated auto-battler that runs as a Firebot custom script, letting a streamer's viewers battle live on stream.
- Live-service architecture: persistent viewer accounts and weapon state carried across sessions, currency, and Twitch Prediction betting that resolves and pays out against battle results.

Limb From Limb

Game Jam, Engineering Lead, \$5K GameName Game Jam, 343 entries (April 2026)

- Led engineering on a four-person team (two programmers, art director, artist) to ship a complete game in two weeks.
- Scoped and delivered the full mechanic, combat and platforming systems under a hard two-week deadline.

LoL Draft Simulator

Supabase, Network Architecture, Data Analysis, Full-stack Unity (Nov 2024 - Present)

- Developed a collectible card game prototype in Unity where players collect cards of real League of Legends competitors, build synergistic rosters, and compete in strategic ban-pick tournaments.
- Wrote Python scripts to programmatically scrape and import millions of player and game metrics using the CargoQuery API.
- Trained a logarithmic regression model using scikit-learn to calculate roster strength and apply categorical weighting for strategic game modes.

TECHNICAL SKILLS

Languages: C#, C++, Python, JavaScript, TypeScript, PostgreSQL, Java, HLSL

Engines and Tools: Unity 6, Unreal, Addressables, custom editor tooling, Firebot, Twitch API, OBS

Cloud and Data: AWS (API Gateway, Lambda, DynamoDB, Cognito, IAM, CloudFormation, CLI), Supabase, scikit-learn, Pandas, NumPy

Practice: AI-assisted and spec-driven development with Claude, rapid prototyping, live-service architecture, technical documentation, cross-discipline collaboration

EDUCATION

New York University, Tandon School of Engineering

B.S. Integrated Digital Media, Minor in Game Engineering (2015 - 2019)

Dean's List 2016-2017. Coursework: Game Programming, Data Structures and Algorithms, Object Oriented Programming, Artificial Intelligence.
